Plan horizon	Age 90		

Headline metrics

TOTAL STARTING WEALTH \$810,000	AVERAGE NET INCOME \$5,094/mo
PROJECTED ENDING WEALTH (AGE 90) \$2,798,606	LIFETIME FEDERAL TAX TO AGE 90 \$91,353
CONFIDENCE SCORE 100/100 Complete · 8/8 checks ✓	

Phase-by-phase plan

Phase 2 — ages 62–65 · 36 months	
401k withdrawal	\$2,800/mo
Cash withdrawal	\$1,200/mo
Equity withdrawal	\$800/mo
Gross income	\$4,800/mo
Federal tax	−\$168/mo
ACA premium est.	−\$217/mo
MAGI headroom to 250% FPL Silver-CSR ceiling	\$5,137
Net income (nominal)	\$4,415/mo
in today's money	\$4,224/mo
Ending balances — 401k: \$504,659 · Cash: \$21,484 · Equity: \$168,802 · Roth: \$123,293	

Phase 3 — ages 65–67 · 24 months	
401k withdrawal	\$3,000/mo
Cash withdrawal	\$800/mo
Equity withdrawal	\$800/mo
Gross income	\$4,600/mo
Federal tax	−\$171/mo
Medicare premiums (Part B + Part D)	−\$274/mo
Net income (nominal)	\$4,155/mo
in today's money	\$3,692/mo
Ending balances — 401k: \$503,216 · Cash: \$3,249 · Equity: \$184,847 · Roth: \$141,763	

Phase 4 — ages 67–73 · 72 months

401k withdrawal	\$2,200/mo
Cash withdrawal (set \$100/mo, account short)	\$48/mo
Equity withdrawal	\$500/mo
US Social Security	\$2,988/mo
Gross income	\$5,736/mo
Federal tax	−\$206/mo
Medicare premiums (Part B + Part D)	−\$309/mo
Net income (nominal)	\$5,221/mo
in today's money	\$4,122/mo

Ending balances — 401k: \$568,788 · Cash: \$0 · Equity: \$286,921 · Roth: \$215,494

Phase 5 — ages 73–90 · 204 months

401k withdrawal	\$3,000/mo
Cash withdrawal (set \$100/mo, account short)	\$0/mo
Equity withdrawal	\$300/mo
US Social Security	\$4,042/mo
Gross income	\$7,342/mo
Federal tax	−\$325/mo
Medicare premiums (Part B + Part D)	−\$434/mo
Net income (nominal)	\$6,583/mo
in today's money	\$3,699/mo

Ending balances — 401k: \$692,820 · Cash: \$0 · Equity: \$1,399,885 · Roth: \$705,901

Balance trajectory

Projected account balances at the end of each phase, based on your withdrawal strategy and growth assumptions. A zero balance in an income-producing phase is flagged — see notes below.

PHASE	401K	CASH	EQUITY	ROTH	TOTAL
Starting (age 62)	\$500,000	\$60,000	\$150,000	\$100,000	\$810,000
Phase 2 (ages 62–65)	\$504,659	\$21,484	\$168,802	\$123,293	\$818,237
Phase 3 (ages 65–67)	\$503,216	\$3,249	\$184,847	\$141,763	\$833,074
Phase 4 (ages 67–73)	\$568,788	\$0	\$286,921	\$215,494	\$1,071,202
Phase 5 (ages 73–90)	\$692,820	\$0	\$1,399,885	\$705,901	\$2,798,606

Asset allocation

Portfolio composition at plan start vs. end (age 90). This is a high-level account-mix view, not a holdings-level rebalancing analysis — the planner does not track individual funds.

By account type (start → end)

401k	62% → 25%
Cash	7% → 0%
Equity	19% → 50%
Roth	12% → 25%

By tax treatment (start → end)

Tax-deferred (401k/Super)	62% → 25%
Taxable accounts (cash + equity)	26% → 50%
Tax-free (Roth)	12% → 25%

You hold a healthy mix across tax treatments — tax-free Roth assets give the surviving spouse and your heirs valuable flexibility.

Balance & legacy considerations

⚠ Significant 401k balance at plan end

A \$692,820 401k balance remaining at age 90 will continue generating Required Minimum Distributions (RMDs) — the IRS forces withdrawals of approximately \$56,789/yr at this balance. These withdrawals are taxable ordinary income and may push into higher brackets, increase IRMAA Medicare surcharges, and make up to 85% of Social Security taxable. Consider whether accelerating 401k withdrawals or Roth conversions in earlier phases would reduce this liability.

i Substantial portfolio remaining at plan end

\$2,798,606 (approximately 346% of starting wealth) is projected to remain at age 90. This may be intentional legacy or inheritance planning — if so, this is working as designed. If the goal is maximum income, earlier phases may have room for higher withdrawals. Either way, these assets will pass to beneficiaries under standard estate rules; a will, beneficiary designations, and potential estate-planning review are recommended.

✓ Healthy Roth balance at plan end

\$705,901 in the Roth at age 90 is a tax-free legacy asset — heirs inherit it income-tax-free, and it carries no RMD obligation during your lifetime. This is one of the most tax-efficient assets to pass on.

⚠ **Cash depleted in Phase 4**

Cash reserves reach zero by the end of Phase 4 (ages 67–73). Any cash withdrawal you set in a later phase cannot be paid, so the income shown from here on excludes it. Cash is also the lowest-risk, most-liquid buffer — with none remaining, an unexpected expense must be met by selling equities or drawing from the 401k, potentially at an inopportune time.

Portfolio charts

Visual summary of how your account balances and net income evolve across the plan.

Plan strengths

Confidence 100/100 — Complete. The remaining items are optimizations to fine-tune, not requirements. 8 of 8 applicable checks are passing. Checks are tiered by importance (Essential, Recommended, Optimization, Optional) — a plan can be complete without every check green; the items below are working in your favour:

✓ **Income Adequacy** ESSENTIAL

All phases show positive income and real purchasing power remains above 50% of the starting phase.

✓ **Tax Bracket Efficiency** OPTIMIZATION

All phases keep taxable income within efficient bracket territory.

✓ **ACA Subsidy Protected** OPTIMIZATION

ACA subsidies are protected across all pre-Medicare phases — MAGI sits between 100% and 400% FPL, within the 250% Silver-CSR ceiling.

✓ **IRMAA Not Triggered** OPTIMIZATION

MAGI stays below IRMAA thresholds in all phases — no Medicare surcharges triggered.

✓ **Portfolio Survives to End** ESSENTIAL

Portfolio balances remain healthy through all phases.

✓ **RMD Compliance** RECOMMENDED

No RMD shortfall detected — withdrawals meet required minimum distribution rules.

✓ **Income Floor Foundation** RECOMMENDED

Guaranteed income covers 55% of average monthly income — a strong, resilient floor that protects the majority of your income from market risk.

✓ **Stress Test Resilient** RECOMMENDED

Drawn-from accounts survive a bear scenario (returns -3%, inflation 5%) to age 90. The plan has meaningful resilience against adverse conditions. (Untouched legacy balances are excluded from this test so they cannot mask depletion of the accounts you actually live on.)

Top risks

No active risks flagged — all relevant Plan Health checks are currently passing.

Recommended next actions

1. Consider Roth conversions in low-income years. You have a Roth balance but no conversions scheduled — converting during lower-bracket phases moves money to tax-free for life at minimal cost.
-

Plan resilience

How the plan holds up under uncertainty — random return sequences (Monte Carlo) and combined inflation / return stress scenarios. These are scenario analyses, not guarantees.

Confidence summary

100/100 Strong
Complete — The remaining items are optimizations to fine-tune, not requirements.

Your plan passes **8 of 8** Plan Health checks. In Monte Carlo it stays solvent in **100%** of randomized runs to age 90. Against real market history it survived **71 of 71** retirements since 1928 (**100%**); the toughest start year was 1930. No single dominant weakness — the plan looks robust across all three lenses.

Three independent lenses — a Plan Health checklist, a random Monte Carlo simulation, and a replay against real market history — viewed together. Agreement across all three is a stronger signal than any one alone. The 0–100 score is an educational estimate, not a guarantee; because checks are tiered by importance, a plan can be complete without every check green.

Monte Carlo simulation

Across **500** randomized simulations to age 90, your plan ended solvent (money still remaining) in **100%** of runs — a strong result.

PROBABILITY SOLVENT 100%	WORST 10% (P10) AT 90 \$629,317
MEDIAN (P50) AT 90 \$5,396,483	BEST 10% (P90) AT 90 \$35,977,820

Each simulation draws annual returns for each account from a normal distribution around your assumed rates, and applies your cash lump-sum events (windfalls in / one-time expenses out). Because the simulation is random, this percentage may vary by a point or two between reports.

Stress test — 12 combined scenarios

Real (today's money) net monthly income and ending portfolio at age 90, across four inflation levels × three return outcomes. Blue = your base case; red = portfolio depleted before plan end.

	Bear (−3%)	Base returns	Bull (+3%)
Low inflation (2%)	\$4,146/mo \$816,500	\$4,266/mo \$2,798,606	\$4,275/mo \$8,369,068
Base inflation (3%)	\$3,832/mo \$816,500	\$3,934/mo \$2,798,606	\$3,942/mo \$8,369,068
High inflation (5%)	\$3,319/mo \$816,500	\$3,395/mo \$2,798,606	\$3,402/mo \$8,369,068
Very high inflation (8%)	\$2,743/mo \$816,500	\$2,799/mo \$2,798,606	\$2,804/mo \$8,369,068

Historical backtest

Replayed against every overlapping 28-year period of actual US market returns since 1928 (data through 2025; growth buckets 60% stocks / 40% bonds), the plan stayed solvent in **100%** of historical retirements (71 of 71). The toughest start year was **1930** (ended \$558,134); median ending balance \$4,318,095.

Historical returns replay the actual sequence of past markets (Damodaran/NYU Stern) — a complement to the Monte Carlo above, not a guarantee of future results.

Key assumptions

Investment returns

401k annual growth	7.0%
Cash annual growth	3.8%
Equity annual growth	10.0%
Roth annual growth	7.0%

Inflation & pension growth

General inflation	3.0%/yr
US SS COLA	2.6%/yr

Tax parameters (current values)

Standard deduction (single)	\$16,100
Age 65+ additional deduction	\$2,050
12% bracket ceiling (single)	\$50,400
22% bracket ceiling (single)	\$105,700
IRMAA threshold (single)	\$109,000
ACA 400% FPL cliff (single)	\$62,600
Medicare Part B / D est.	\$203/mo / \$41/mo
IRMAA Tier-1 surcharge (if triggered)	\$96/mo
NIIT threshold (single)	\$200,000

Disclaimer

This document was generated by the **AI Retirement Income Planner v7** on 2026-09-16. It reflects the plan as configured on that date and the tax / threshold values stored at that time. Tax laws and FPL / IRMAA thresholds change annually — the figures in this document may be out of date as soon as the new tax year begins.

All numbers, balances, threshold comparisons, and Plan Health checks shown above are computed deterministically from the inputs you entered. They are **projections based on your assumptions** (investment returns, inflation, tax law continuity) and will differ from actual results, often significantly. Sequence-of-returns risk, legislative change, health events, and life choices not modelled here can all move outcomes materially.

The **Monte Carlo and stress-test results** are scenario analyses that illustrate a range of possible outcomes under randomised or adverse conditions — they are not predictions or guarantees. The Monte Carlo figure is computed from your plan inputs and is reproducible for a given plan; it updates when you change your inputs. The **asset-allocation** section is a high-level account-mix summary, not holdings-level rebalancing advice.
